Co-1 Assessment Tool - 3

Ethical Hacking and Hacker Spectrum :-

Ethical Hacking :- Releasing a working exploit Publicly before the vendor issue a Security Patch is generally not considered responsible ethical hacking. Although the researcher's intention may be to Pressure the vendor into fixing the vulnerability, Public disclosure can allow cyber criminals to exploit the weakness and attack vulnerable systems.

Hacker Spectrum :- The researcher can be classified as Grey-hat-Hacker because they may have good intentions but disclose the vulnerability Publicly before it is fixed. Grey-hat-hackers operate between ethical (white hat) and malicious (black-hat) hacking.

Ethical Approach :- The researcher should report the vulnerability Privately to the vendor, allow reasonble time for a patch to be develop, and co-ordinate public disclosure to minimize risks to users.

Balanced Ethical Analysis :-

* Public disclosure can pressure vendors to address to security vulnerabilities promptly.
* It raises Public awareness about Potential Security risks.
* It promotes transparency and accountability among software vendors.

* It may prevent vendors from ignoring serious vulnerabilities.

Ethical Approach :- A more responsible approach is co-ordinated vulnerability disclosure. The researcher should privately inform the vendor, Provide sufficient technical details to reproduce Period for remediation. If the vendor fails to respond, the researcher may consider escalating the matter to a trusted Security Co-ordination organization or making a carefully limited public disclosure that minimizes the risk to users.

Conclusion :- The researcher's actions cannot be judged solely but their intentions. Although Public disclosure may encourage vendors to fix vulnerabilities, releasing a working exploit before a Patch is available can cause significant harm. Therefore, the researcher is best described as Grey-Hat-Hacker, and the action is ethically questionable rather than automatically ethical or unethical in every circumstance. Responsible disclosure generally provides a better balance between Public accountability and User Safety.
